

Week 11 Interactive Component

Jake Appling

Future without AI's Impact

Slower innovation in medicine, transportation, engineering, and communication

More tedious busy work done by humans

More delays in services that require coordination

Traditional cities, less automation

Future with AI

Smart cities with connected traffic systems, energy grids, and public services

Better predictive systems for maintenance, weather response, logistics, and safety

Faster advances in healthcare, science, transportation, and infrastructure

Daily life may become more convenient through automation and predictive systems

2050: Filture with AI

Construction without AI

More frequent delays caused by communication gaps and slower decision-making

Safety monitoring relying mainly on supervisors

More rework because clashes, errors, or sequencing issues may be caught later

Human labor doing more of the layout, inspection, and quality-control work

Construction with AI

Drones and cameras tracking progress automatically

Predictive maintenance for heavy equipment and tools

Robots or autonomous machines handling repetitive or hazardous tasks

AI support for estimating, risk analysis, and resource planning

Smarter material logistics that reduce waste and delivery problems
