

AI in Higher Education

Week 15 Summary

Jake Appling

Key Themes

- Student AI use is widespread
- Faculty adoption is growing but cautious
- AI literacy, ethics, and responsible use matter

Students Are Leading AI Adoption

Student use of AI is already widespread in higher education.

- Surveys cited in the article show student AI use around 80% to 92%
- Common uses include studying, writing, brainstorming, and summarizing
- AI is becoming part of students' everyday academic workflow

Faculty Adoption Is More Cautious

Faculty use of AI is growing, but it still trails student adoption.

- Many instructors have tried AI tools, but most use them minimally
- Colleges are still catching up in guidance, training, and expectations
- This creates a gap between student use and institutional preparedness

AI Literacy Is Now Essential

The article argues that people must learn to use AI responsibly and effectively.

- Students and faculty often feel underprepared to use AI well
- Major concerns include accuracy, bias, privacy, and over-reliance
- Academic integrity and cheating remain major issues for schools

Broader Implications for Society

AI is becoming a basic skill for education and future work.

- People who learn AI responsibly may be better prepared for modern jobs
- Unequal access and training could widen existing educational gaps
- Schools will need more focus on ethics, critical thinking, and guidance

Learning and Originality Are Being Reframed

AI is changing how schools think about knowledge and honest work.

- Educators may need to rethink originality and what meaningful learning looks like
- It is becoming harder to judge whether work reflects true understanding
- Clear policies and responsible use standards will become more important

Why This Matters to Construction

Construction education and practice will face many of the same AI challenges.

- Future construction teams may use AI for research, scheduling, estimating, and reports
- AI should support decision-making, not replace professional judgment
- Users must verify outputs to protect safety, cost, quality, and compliance
